Profiles of Major Products under Development (As of January 30, 2020)

1. **Psychiatry & Neurology**

   **[Dasotraline (SEP-225289)]**  Developed in-house (Sunovion Pharmaceuticals Inc.). Formulation: oral

   - SEP-225289 is a dopamine and norepinephrine reuptake inhibitor (DNRI). SEP-225289 has an extended half-life (47-77 hours) that supports the potential for plasma concentrations yielding a continuous therapeutic effect over the 24-hour dosing interval.
   - Development stage:
     - Binge eating disorder (BED): NDA submitted in the U.S. in May 2019
     - Attention-deficit hyperactivity disorder (ADHD):
       - U.S.: NDA submitted in August 2017, Complete Response Letter received in August 2018, development strategy under consideration
       - Japan: Phase 1 in Japan

   **[Apomorphine Hydrochloride (APL-130277)]**  Developed in-house (Sunovion Pharmaceuticals Inc., from former Cynapsus Therapeutics). Formulation: sublingual film

   - APL-130277 is a sublingual film formulation of apomorphine, a dopamine agonist, which is the molecule approved for acute intermittent treatment of OFF episodes associated with Parkinson’s disease. It is designed to rapidly, safely and reliably convert a Parkinson’s disease patient from the OFF to the ON state while avoiding many of the issues associated with subcutaneous delivery of apomorphine.
   - Development stage: NDA submitted in the U.S. in March 2018
     - NDA resubmitted in the U.S. in November 2019

   **[SEP-363856]**  Developed in-house (Joint research with Sunovion Pharmaceuticals Inc. and PsychoGenics Inc.). Formulation: oral

   - SEP-363856 is an antipsychotic agent with a novel mechanism of action and doesn’t show affinity to dopamine D2 receptors. Sunovion discovered SEP-363856 in collaboration with PsychoGenics using its in vivo phenotypic SmartCube® platform and associated artificial intelligence algorithms. The molecular target(s) responsible for the profile of effects is unknown, but may include agonist effects at serotonin 5-HT1A and TAAR1 (trace amine-associated receptor 1) receptors. Phase 2 results in patients with schizophrenia support the efficacy of SEP-363856 in treating both positive and negative symptoms of schizophrenia, while demonstrating a side effect profile with notable similarities to placebo; extrapyramidal symptoms, weight gain, lipid and glucose derangements, cardiovascular abnormalities or prolactin elevation.
   - Development stage:
     - Schizophrenia: Phase 3 in the U.S.
     - Parkinson’s disease psychosis: Phase 2 in the U.S.
     - Schizophrenia: Phase 1 in Japan

   **[Vatiquinone (EPI-743)]**  In-licensed from PTC Therapeutics, Inc. (Acquired from BioElectron Technology Corporation). Formulation: oral

   - EPI-743 is expected to show efficacy by removing the oxidative stress that is generated excessively by decreased mitochondrial function. It is expected to be the world’s first treatment for mitochondrial diseases, beginning with Leigh syndrome, for which there is no effective therapy.
   - Development stage:
     - A Phase 2 / 3 study for Leigh syndrome in Japan completed, development strategy under consideration
Profiles of Major Products under Development

EPI-589
In-licensed from PTC Therapeutics, Inc.  (Acquired from BioElectron Technology Corporation), Formulation: oral

- EPI-589 is expected to show efficacy by removing the oxidative stress that is generated excessively by decreased mitochondrial function. It is expected to be developed for neurodegenerative indications arising through redox stress.
  - Development stage:
    - Parkinson’s disease: Phase 2 in the U.S.
    - Amyotrophic lateral sclerosis (ALS): Phase 2 in the U.S.
    - Amyotrophic lateral sclerosis (ALS): Phase 1 in Japan

SEP-4199
Developed in-house (Sunovion Pharmaceuticals Inc.), Formulation: oral

- SEP-4199 is investigated for the treatment of major depressive episodes associated with bipolar I disorder. The mechanism of action is not disclosed at this time.
  - Development stage:
    - Bipolar I depression: Phase 2 in the U.S. and Japan

DSP-6745
Developed in-house, Formulation: oral

- DSP-6745 is a serotonin 5-HT\textsubscript{2A} and serotonin 5-HT\textsubscript{2C} receptors dual antagonist, which is expected to be effective for Parkinson’s disease psychosis and one or more Parkinson’s disease non-motor symptoms (depression, anxiety, or cognitive impairment). In addition, DSP-6745 has negligible affinity for dopamine D\textsubscript{2} receptors.
  - Development stage: Parkinson’s disease psychosis: Phase 1 in the U.S.

SEP-378608
Developed in-house (Joint research with Sunovion Pharmaceuticals Inc. and PsychoGenics Inc.), Formulation: oral

- SEP-378608 is a novel CNS-active molecule. Sunovion discovered SEP-378608 in collaboration with PsychoGenics using its in vivo phenotypic SmartCube\textsuperscript{®} platform and associated artificial intelligence algorithms. Pre-clinical studies suggest that it may modulate neuronal activity in key areas of the brain associated with the regulation of mood.
  - Development stage: Bipolar disorder: Phase 1 in the U.S.

DSP-3905
Developed in-house, Formulation: oral

- DSP-3905 is an agent that selectively inhibits voltage-gated sodium channels Nav1.7. Based on its inhibitory mode of action, the agent is expected to show a potent analgesic effect on the pain occurring when neurons get excessively excited. In addition, DSP-3905 has a high selectivity for Nav1.7 expressed in peripheral neuron and may not produce central nervous system or cardiovascular system side effects, which are present with the current drugs for neuropathic pain.
  - Development stage: Neuropathic pain: Phase 1 in the U.S.

SEP-378614
Developed in-house (Joint research with Sunovion Pharmaceuticals Inc. and PsychoGenics Inc.), Formulation: oral

- SEP-378614 is a novel CNS-active molecule. Sunovion discovered SEP-378614 in collaboration with PsychoGenics using its in vivo phenotypic SmartCube\textsuperscript{®} platform and associated artificial intelligence algorithms. Pre-clinical studies suggest that it may have rapid onset and long lasting antidepressant-like activity and enhance neuroplasticity.
  - Development stage: Treatment resistant depression: Phase 1 in the U.S.
Profiles of Major Products under Development

SEP-380135

- Developed in-house (Joint research with Sunovion Pharmaceuticals Inc. and PsychoGenics Inc.), Formulation: oral
- SEP-380135 is a novel CNS-active molecule. Sunovion discovered SEP-380135 in collaboration with PsychoGenics using its in vivo phenotypic SmartCube® platform and associated artificial intelligence algorithms. Pre-clinical studies showed a broad range of in vivo activities suggesting efficacy against a number of behavioral and psychological symptoms in dementia, including agitation/aggression, psychomotor hyperactivity, depression and deficits in social interaction.
- Development stage: Agitation in Alzheimer’s disease: Phase 1 in the U.S.

DSP-1181

- Developed in-house, Formulation: oral
- DSP-1181 is a novel compound created by Sumitomo Dainippon Pharma using Exscientia’s AI technologies. In contrast to conventional serotonin 5-HT1A receptor partial agonists (non-benzodiazepine anxiolytics), DSP-1181 has a potent full agonistic activity for serotonin 5-HT1A receptors and is expected to have a long half-life, therefore it is suggested that DSP-1181 has strong efficacy over a long period of time. In Obsessive compulsive disorder (OCD) model mice manipulated OCD-related neural circuit, DSP-1181 is expected to have an earlier onset of efficacy than a standard medication, a selective serotonin reuptake inhibitor (SSRI).
- Development stage: Obsessive compulsive disorder: Phase 1 in Japan.

2. Oncology

napabucasin (BBI608)

- Developed in-house (Boston Biomedical, Inc.), Formulation: oral
- BBI608 is an orally administered small molecule agent with a novel mechanism of action which is bioactivated by the enzyme NQO1 in cancer cells, which generates reactive oxygen species (ROS) to inhibit cancer stemness and tumor progression-related pathways including STAT3, which is expected to result in cancer cell death.
- Development stage:

 FOLFIRINOX: Combination therapy with fluorouracil, leucovorin, irinotecan, oxaliplatin
**Alvocidib (DSP-2033)**

In-licensed from Sanofi S.A., Formulation: injection

- Alvocidib is a small molecule inhibitor of cyclin-dependent kinase 9 (CDK9), a member of cyclin-dependent kinase family, which activates transcription of cancer-related genes. The subsequent down-regulation of MCL-1, an anti-apoptotic gene, may be responsible for the potential clinical anti-cancer activity observed with Alvocidib.

* Co-development with AbbVie

**Adegramotide/Nelatimotide (DSP-7888)**

Developed in-house, Formulation: injection

- DSP-7888 is a therapeutic cancer peptide vaccine derived from Wilms’ tumor gene 1 (WT1) protein. DSP-7888 is a vaccine containing peptides that induces WT1-specific cytotoxic T lymphocytes (CTLs) and helper T cells. DSP-7888 is expected to become a treatment option for patients with various types of hematologic malignancies and solid tumors that express WT1, by inducing WT1-specific CTLs that attack WT1-expressing cancer cells. By adding a helper T cell-inducing peptide, improved efficacy over that observed with a CTL-inducing peptide alone may be achieved. DSP-7888 is expected to be an option for a wide range of patients.

* Phase 2 stage
**dubermatinib (TP-0903)**
In-licensed from University of Utah, Formulation: oral

- TP-0903 is an AXL receptor tyrosine kinase inhibitor, which is known to be involved in acquiring resistance to conventional agents and developing metastatic capacity in cancer cells. TP-0903 may have anti-cancer activities on various cancer types through blocking transition from epithelial to mesenchymal phenotype by inhibiting AXL. TP-0903 has been shown to inhibit AXL signaling and reverse the mesenchymal to epithelial phenotype in pre-clinical studies.
- **Development stage:**
  - Chronic lymphocytic leukemia (monotherapy / combination therapy): Phase 1/2 in the U.S.
  - Solid tumors (monotherapy / combination therapy): Phase 1 in the U.S. and Japan

**DSP-0509**
Developed in-house, Formulation: injection

- DSP-0509 is a novel Toll-like receptor (TLR) 7 agonist. DSP-0509 may promote the cytokine induction and cytotoxic T lymphocyte (CTL) activation mediated by agonistic effect of TLR 7 expressing in plasmacytoid dendritic cell. Furthermore, DSP-0509 is expected to sustain the immune-mediated anti-cancer activity by induction of immune system memory T cells.
- **Development stage:**
  - Solid tumors (monotherapy / combination therapy): Phase 1/2 in the U.S.

**TP-0184**
Developed in-house (Tolero Pharmaceuticals, Inc.), Formulation: oral

- TP-0184 has an inhibitory effect against kinase such as activin A receptor type 1 (ACVR1, also known as ALK2) kinase and transforming growth factor β receptor 1 (TGFβR1, also known as ALK5), part of the transforming growth factor beta (TGFβ) receptor superfamily. TP-0184 is expected to show anti-cancer activities through the kinase inhibitory effect.
- **Development stage:**
  - Solid tumors (monotherapy): Phase 1 in the U.S.

**DSP-0337**
Developed in-house, Formulation: oral

- DSP-0337 is a small molecule oral prodrug of napabucasin. DSP-0337 is expected to be stable and dispersed in the stomach, and converted to napabucasin in the intestine, which may be absorbed and exert its pharmacologic activities.
- **Development stage:**
  - Solid tumors (monotherapy): Phase 1 in the U.S.

**TP-1287**
Developed in-house (Tolero Pharmaceuticals, Inc.), Formulation: oral

- TP-1287 is a small molecule oral agent that inhibits cyclin-dependent kinase 9 (CDK9). TP-1287 has shown favorable oral bioavailability in preclinical studies. It is enzymatically cleaved, yielding alvocidib, a potent inhibitor of CDK9. The oral administration of TP-1287 may allow for administration for a prolonged period, which may lead to a continuous inhibition of CDK9.
- **Development stage:**
  - Solid tumors (monotherapy): Phase 1 in the U.S.

**TP-3654**
Developed in-house (Tolero Pharmaceuticals, Inc.), Formulation: oral

- TP-3654 inhibits the inflammatory signaling pathways through inhibition of PIM (proviral integration site for Moloney murine leukemia virus) kinases. PIM kinases are frequently overexpressed in various hematologic malignancies and solid tumors, allowing cancer cells to evade apoptosis and promoting tumor growth.
- **Development stage:**
  - Solid tumors (monotherapy): Phase 1 in the U.S.
  - Myelofibrosis (monotherapy / combination therapy): Phase 1 in the U.S.
3. **Regenerative medicine / cell therapy**

**RVT-802**  
In-licensed from Duke University

- RVT-802, a one-time regenerative therapy, is cultured human thymus tissue engineered to generate a functioning immune response when implanted in pediatric patients with congenital athymia. The key source material for RVT-802 is human thymus tissue that has been removed during pediatric cardiac surgery for unrelated conditions. Patients receive RVT-802 in the quadricep muscle during a single surgical procedure. The patient’s own bone marrow stem cells migrate to RVT-802, where they develop into mature T-cells that can fight infection. For patients who respond to RVT-802, a diverse T-cell population is established and thymic function sufficient to protect from infection usually develops between 6 and 12 months post treatment.

- Development stage: Pediatric congenital athymia: BLA submitted in the U.S. in April 2019, Complete Response Letter received in December 2019

**Allo iPS cell-derived products**

- In cooperation with the partners in the industry-academia collaboration, we are promoting toward the commercialization of regenerative medicine / cell therapy using allo iPS cell (healthy patients) for AMD (age-related macular degeneration), Parkinson's disease, retinitis pigmentosa, and spinal cord injury.

4. **Others**

**vibegron**  
In-licensed from Merck Sharp & Dohme Corp., Formulation: oral

- Vibegron is an oral, once-daily, small molecule β3 adrenergic receptor agonist. Vibegron selectively acts on the β3 adrenergic receptor in the bladder, relaxes the bladder, enhances urinary storage, and improves symptoms of urgency, urinary frequency, and urge urinary incontinence in overactive bladder.

- Development stage: Overactive bladder: NDA submitted in the U.S. in December 2019  
  Overactive bladder in men with BPH: Phase 3 in the U.S.  
  IBS-associated pain: Phase 2 in the U.S.

**imeglimin (PXL008)**  
In-licensed from Poxel SA, Formulation: oral

- Imeglimin is a new chemical substance classified as a tetrahydrotriazine compound, and the first clinical candidate in a chemical class. Imeglimin has a unique mechanism of action that targets mitochondrial bioenergetics. Imeglimin acts on all three key organs which play an important role in the treatment of type 2 diabetes: the pancreas, muscles, and the liver, and it has demonstrated glucose lowering benefits by increasing insulin secretion in response to glucose, improving insulin sensitivity and suppressing gluconeogenesis.

- Development stage: Type 2 diabetes: Phase 3 in Japan (Co-development with Poxel)
Profiles of Major Products under Development

relugolix In-licensed from Takeda Pharmaceutical Company Ltd, Formulation: oral

- Relugolix is a once-daily, oral gonadotropin-releasing hormone (GnRH) receptor antagonist that reduces testicular testosterone production, the hormone primarily responsible for stimulating prostate cancer, and ovarian estradiol and progesterone production, hormones known to stimulate the growth of uterine fibroids and endometriosis. Myovant is developing a relugolix monotherapy tablet (120 mg) for men with advanced prostate cancer. Myovant is developing a distinct product, relugolix combination tablet (relugolix 40 mg plus estradiol 1.0 mg and norethindrone acetate 0.5 mg) for uterine fibroids and endometriosis.
- Development stage:
  Uterine fibroids: Phase 3 in the U.S.
  Endometriosis: Phase 3 in the U.S.
  Prostate cancer: Phase 3 in the U.S.

rodatristat ethyl In-licensed from Karos Pharmaceuticals, Inc., Formulation: oral

- Rodatristat ethyl is a prodrug of tryptophan hydroxylase (TPH) inhibitor designed to reduce peripheral production of serotonin without entering the brain. It is believed that rodatristat ethyl may halt or reverse the pathology of diseases that are driven by excessive serotonin production, such as PAH, idiopathic pulmonary fibrosis (IPF) and sarcoidosis.
- Development stage: Pulmonary arterial hypertension (PAH): Phase 2 in the U.S.

MVT-602 In-licensed from Takeda Pharmaceutical Company Ltd, Formulation: oral

- MVT-602 is an oligopeptide kisspeptin-1 receptor agonist. Activation of kisspeptin in upstream hypothalamic neurons is hypothesized to lead to the transmission of a signal that stimulates downstream neurons to increase the secretion of GnRH. Continued stimulation of kisspeptin is thought to result in the desensitization of receptor transduction, which is anticipated to result in a complete cessation of the signaling pathway. Myovant is developing MVT-602 as part of the hormonal preparation for women with infertility undergoing in vitro fertilization. MVT-602 is believed to stimulate GnRH which in turn increases secretion of luteinizing hormone that acts as a trigger for egg maturation prior to oocyte collection.
- Development stage: Female infertility: Phase 2 in Germany

URO-902 In-licensed from Ion Channel Innovations, Formulation: injection

- URO-902 is a novel gene therapy for patients with overactive bladder symptoms who have failed oral pharmacologic therapy. URO-902 is a plasmid vector containing a human cDNA encoding the pore-forming component of the Maxi-K ion channel. Expression of the Maxi-K protein in muscle cells is hypothesized to increase potassium ion flow across the cell membrane, reducing excitability of smooth muscle cells. This mechanism could potentially normalize the heightened detrusor smooth muscle tone in overactive bladder, thereby reducing the symptoms of overactive bladder.
- Development stage: Overactive bladder: Phase 2 in the U.S.
